

Contrastive Decoding is Inert

Parallel top-10 logit tables at hallucinated-object steps (VCD, LLaVA-1.5-7B)

Each example is a decoding step where the model emitted an object absent from the image. Hallucinations are verified with the caption-level CHAIR mapping (double-words collapsed so 'teddy bear' is not mis-split; subword fragments like 'ship' in 'companionship' excluded) AND verified by eye. In every case the expert's own top-1 is already the hallucinated object, and all 10 top candidates are identical across Expert (clean image), Amateur (noised image), and CD (2E-A, post-subtraction). Subtraction leaves the hallucination at rank 1; APC keeps it; it is emitted. No corrective effect.
